

KN95 Mask Information

You are receiving a KN95 mask

KN95 masks are personal protective devices that provide very efficient filtration of airborne particles. They are designed to achieve a very close facial fit with the edges of the mask forming a tight seal around the nose and mouth. When worn properly, they can filter out 95% of small particles including dust, bacteria, and viruses.

KN95 masks are classified as a “negative pressure respirator” which means that the air pressure inside the mask is negative during inhalation with respect to the air pressure outside the mask. This can result in less oxygen and more carbon dioxide being inhaled while wearing the mask and should therefore not be worn for prolonged periods of time.

Anyone with respiratory, cardiac, or other medical conditions should check with their health care provider before wearing a KN95 mask since it can make it more difficult to breathe while wearing it.

If you develop shortness of breath, drowsiness, dizziness, headaches, confusion, or blurred vision while wearing your KN95 mask, you should remove it and not wear it again until you consult your health care provider as to whether or not you should continue wearing a KN95 mask.

You should not share your KN95 mask with anyone to avoid potentially infecting others.

If your KN95 mask becomes damaged or soiled, you should remove it, discard it properly, and replace it with a new one.

KN95 masks are not designed for children or people with facial hair. Because a proper fit cannot be achieved on children and people with facial hair, the KN95 mask may not provide full protection.

I acknowledge reading the above information regarding KN95 masks.
